## INTRODUCTION

I/O Plexers are remote I/O devices controlled by instructions sent from a Host computer over a serial communications line. The control communication protocol is that of speak-only-when-spoken-to. Only the host can initiate a response from a remotely located I/O plexer. In order to confirm communication link operation, all instructions return either an acknowledgment or an acknowledgment with data. All messages sent by the host must be made up of printable ASCII characters; they are the only characters recognized by the I/O plexer. Each I/O Plexer has a unique Master Control, Master Digital, Master Analog and Digital expander 1 address. Only the addressed I/O Plexer responds to an instruction.

| ADDRESS DECODING |  | POSSIBLE ADDRESSES OF I/O PLEXER FUNCTIONS |
| :---: | :---: | :---: |
| Incoming <br> Instruction | >>>> | MC-Master Control address |
|  | >>>> | MD-Master Digital address |
|  | >>>> | MA-Master Analog address |
|  | >>>> | DE-Digital Expander 1 address |
|  | >>>> | MF-Master Future address |

This addressing scheme is used to allow the I/O Plexer to access both digital and analog modules as well as serial I/O on the same physical chassis.

When dealing with a system equipped with a digital expander 1 simply treat it as if it were a normal Master Digital address.

Refer to section 2 of this manual for communication details when making the I/O Plexer to host computer connections.

This instruction/ response interchange is handled by the host computer in a variety of ways.

Instructions could be sent using a terminal emulation package such as PROCOMM ${ }^{\mathrm{TM}}$ or HyperACCESS ${ }^{\mathrm{TM}}$. With these programs, the operator would hand-build and enter the actual instruction string directly to the I/O Plexer. This would be impractical for normal operation but is good for debugging and experimentation.

The next higher level of interaction between the Host and I/O Plexer would be the MAGIC disk included with each copy of this manual. This menu driven program guides the user through building any instruction, sends that instruction to the I/O Plexer, and then displays the corresponding response. Magic disk is an excellent tool for experimentation and debugging hardware as well as software. However this program is not designed for continuous, hands-off, operation. For details concerning the MAGIC disk, see appendix J.

The above methods provide system design/ troubleshooting help but do not offer automated operation. Since acquiring data and/ or implementing control decisions is the real purpose of the I/O Plexer, the host computer needs an algorithm to follow.

This algorithm directs the Host to poll the I/O Plexer for the required information. Once acquired, this data is manipulated inside the host. Control decisions, if any, are then made. Based upon these decisions, instructions are sent to the I/O Plexer to manipulate the correct outputs. Acquired data may be stored or dealt with graphically and control decisions may be changed based on external stimuli such as operator input or time of day.

There are two main types of programs a Host can run; third party software or user written programs.

Third party software comes pre-written to accomplish a specific set of goals. Of the dozens of different packages, each has its strong and weak points. The user need only choose the package which best suits his application needs. Many of these packages have the ability to communicate with several different types of external hardware at the same time, using specific drivers designed for each device. Once chosen, the package is installed and configured with application specific details such as: I/O Plexer addresses and parameters associated with each module. Once these packages are set up and activated, little effort is needed to operate the system. Technical support is usually available directly from the manufacturer. For a list of software that has been tested with our product please refer to appendix F. Please note: This list is always changing. Please call if the third party software the user wants to use is not listed.
(1-800-248-1632)
User written software is the most versatile of application specific Host programs. Generally developed by in-house programmers, user programs may be written in any language which supports serial communication. Typically these programs are written in BASIC, PASCAL, C or assembly language. In the case of user developed programs, support and documentation is the sole responsibility of the user. Appendix G is a simple BASIC program that demonstrates Host-I/O Plexer communications.

Local control functions (LCF) allow the I/O Plexer to control its process without Host intervention. This is an exception to the normal operation which is only under host control.

## Local Control Functions (LCF)

Occasionally it is convenient to have an I/O Plexer make control decisions based on its I/O without Host intervention. This control is useful for a variety of purposes, such as; Host backup, communication load reduction, and Input/ Output reaction time. LCF's provide a means to implement these capabilities.

Local control functions allow the I/O Plexer to make decisions based upon its own inputs. These decisions can be implemented by changing outputs without action by the Host. LCF's provide several building blocks for describing the decision making. The use of this feature enhances the power of the I/O Plexer.

Having an I/O Plexer with the /L option installed (See unit part number) is a prerequisite for using local control functions. If the I/O Plexer is to remember these functions from power cycle to power cycle without being reconfigured each time, the / M option (battery backed-up memory) is also required.

## INTRODUCTION

Hosts can transmit four types of instructions:
SETUP- Initialization used only once following a power recycle.
INPUT- Process input module data from sensors to provide the Host with information for control decisions. These can be analog or digital.

OUTPUT- Provide output module actuating information for carrying out control decisions. These can be analog or digital.

SERIAL I/O- Provides the use of an additional RS-232 port for the exchange of messages or data between the Host computer and an external RS-232 device.

As instructions are introduced in this manual, the function names, which are "setup", "analog input", "Digital input", "Analog output", Digital output", or "serial I/O" appear before the instruction.

## I/O Plexer NUMBER SYSTEM:

I/O Plexer uses hexadecimal (Abbr. HEX) numbering subscript H , for example 8H, is used to designate a hexadecimal number and subscript D is used to designate a decimal number, for example 3D. Assume it is a decimal if not specified. For more details refer to appendices E and I.

As part of its power -up tests, the I/O Plexer determines which modules are analog and which are digital (empty positions are declared digital). All modules are initially set up as inputs. Outputs must be configured before sending any other instructions to the output modules. It is suggested that input modules be configured before using them to avoid errors.

## INSTRUCTIONS:

Host initiated instructions have up to six elements. Five of which are always included. the format of all instructions is shown below.
$>$

Start of
Instruction

Carriage
Instruction
Character

Return
Checksum

Start of Instruction: A greater than sign ( $>$ ) is always required to start an instruction.
Address: Each I/O Plexer contains 5 units, each with its own address. A two letter code is shown for each address. The addresses are always accessible by looking at the tow characters on the red flashing sequential display. Addresses can range from 00H to FFh.

ADDRESS TABLE

| Address |  | IOP Display |
| :--- | :--- | :--- |
| 2 Letter abbreviation in <br> documentation |  |  |
| Master Control | $\mathrm{U} 0=? ?$ | $M C$ |
| Master Digital | $\mathrm{U} 1=? ?$ | $M D$ |
| Master Analog | $\mathrm{U} 2=? ?$ | $M A$ |
| Digital Expander 1 | $\mathrm{U} 3=? ?$ | $E 1$ |
| Master Future | $\mathrm{U} 4=? ?$ | $M F$ |

Some Addresses have counterparts in more than one unit.

| Digital | U 1 or U3 | $D D$ |
| :--- | :--- | :--- |
| Actual I/O address | $\mathrm{U} 1, \mathrm{U} 2$, or U3 | $I O$ |
| Any Address | $\mathrm{U} 0, \mathrm{U} 1, \mathrm{U} 2, \mathrm{U} 3$ | $A U$ |

(Effects only the address it is sent to)
Applies to all addresses
Attached to IOP
simultaneously U0, U1, U2, U3 $L U$

* Master Future is reserved for future use. It defaults to the master Control address. All address features not present in a given I/O Plexer such as Master Analog or Digital expander 1 default to the Master control address.

Function Code(s): Function codes are unique to each instruction. Instructions are explained in detail later in this section and are summarized on the Quick Reference Guide.

Instruction Content: Instruction contents follow the function code. They usually contain a position field that specifies which module is to be acted upon. They may also contain additional modifiers and data that tells the module what specifically should take place.

## POSITION FIELD

Most I/O Plexer instructions have a position field following the function code. The contents of this field determine which modules are affected by the instruction. Some instructions affect all modules. In these, the position field determines what the effect is for each module. In either case, the construction of the position field follows the same rules.

The position field is a 4 digit hex representation of a 16 digit number. Written this way, each digit of the 16 digit number (one digit for each possible module) can only be a 1 or a 0 . (These 1 or 0 are called bits)

To fill the position field, perform the following steps:

1. Make a list of the modules that the instruction is to affect, for example: $0,3,8,12,14$, and 15 .
2. Make a 16 digit number with a 1 in each position listed in step 1 and a 0 in all the other positions. The left most digit of the number is module 15 , the right most is module 0 . The number for our example is:

3. Divide the number built in step 2 into 4 digit numbers. Our example appears as: 1101000100001001.
4. Using the table below, look up each of the 4 digit numbers in step 3 and replace it with the corresponding hex number or letter. Our example becomes D109H. This is the value that should be put in the position field of the instruction. This table is on the Quick Reference Guide for easy access.

| Module\#: | 15141312 | 111098 | 6 | 3210 |
| :---: | :---: | :---: | :---: | :---: |
|  | -1 ${ }^{\text {st }}$ Char- | $-2^{\text {nd }}$ Char- | $-3^{\text {rd }}$ Char- | $-4^{\text {th }} \mathrm{C}$ |

| Bit pattern | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 0111 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Hex Digit: | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Bit Pattern: | 1000 | 1001 | 1010 | 1011 | 1100 | 1101 | 1110 | 1111 |
| Hex Digit: | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |

5. It is always acceptable to use a 4-digit value in an instruction which requires a position field. Some instructions also accept an abbreviated version which has had the leading hex zeroes omitted. Some instructions consider the position field to be optional and assume a position field of FFFFH (All modules affected) if it is omitted.

## Modifier/ Data Field

The Modifier/ Data field contains any additional information for the instruction. The size of this field is dependent on the instruction. The information in this field may be a letter corresponding to information presented in a table such as the $h$ to select 1200 buad rate in the Serial N instruction or it may be actual variable data such as OFE for $k$ in many of the analog instructions. These fields are explained in detail on each individual instruction page.

| Checksum: | All I/O Plexer instructions, and responses with data, require a <br> checksum. The checksum provides a means of confirming that the <br> communications link has not distorted or garbled the instruction <br> message. The checksum is computed by adding the decimal values <br> (Appendix H) of all the ASCII characters in the message excluding the |
| :--- | :--- |
| start instruction character, ">" for instructions, and the "A" for |  |
| responses. Subtract 256 until the number is less than 256 . Convert this |  |
| remaining number to two hex digits. This is the checksum. For |  |
| debugging purposes a wildcard checksum can be used. "??" acts as |  |
| any correct checksum. For more information, refer to appendix B. |  |

Responses: The response depends on the instruction purpose, the communications protocol, and the correctness of their assembly. The general form of a response is listed below. For a detailed form, refer to each individual instruction. For 4 pass information, refer to section 2 of this manual.
$\left.\begin{array}{cc}\text { Acknowledgment } & \text { Response Content (if needed) ( ) CR } \\ \text { Checksum if } \\ \text { Response Content }\end{array} \right\rvert\,$
Carriage Return
Acknowledgment : A response that is an "A" or that starts with an "A" with data appended to it means the I/O Plexer received the instruction and executed it.

Response Content: These fields are similar to the ones described earlier in the instruction section. It can consist of a position field, data, modifier field, or other information.

Checksum: Checksums appear only with responses that contain data. For more information on checksums, refer to appendix B.

Carriage Return: This is the end of response character, CR, and is always present.

Special Response Messages:
Special response messages are returned if unusual conditions are present. The condition can be the result of improper instruction assembly or noise in the communication link.

Message $\quad$ Meaning

| N00 | Power has been off. An instruction other than the setup A <br> instruction was attempted after a power cycle. This is a <br> warning that the system needs to be reconfigured. The <br> only exception occurs if the I/O Plexer has the /M option <br> and setup eF is used. See N09for more information. |
| :--- | :--- |
| N01 | Invalid instruction. This is returned if an invalid function <br> code is used such as v for V |
| N02 | Checksum error. Checksum received is not equal to the <br> calculated checksum. |
| N02 *( )* | Checksum error after Setup eC instruction was sent. The <br> correct checksum for the message received is between the <br> asterisks. |
| N03 | The received checksum exceeded 80 characters. |
| N04 | Non-Printable character. Only ASCII Characters from 21H <br> to 7FH are permitted within instructions. For an ASCII <br> conversion table see appendix H. |

| N05 | Invalid instruction length. Too many or too few characters <br> were received. For example, this response is returned if a <br> position field requires 6 data fields and only 5 are <br> included. |
| :--- | :--- |
| N06 | Communication watchdog timed out. This only occurs if <br> Setup D and or setup M instructions are used and a <br> watchdog failure occurs. The next instruction sent after the <br> timeout occurs , responds with N06 and is not executed. |
| N07 | Invalid Data. This is returned when the I/O Plexer receives <br> data not allowed in that field. |
| N08 | Invalid Module |
| N09 | Battery backed restart OK. This is similar to N00 message <br> except this unit has a battery backed memory and came up <br> running with the configuration saved using setup eF. |
| N10 \&N11 | Reserved for local control function errors. |
| N12 | Local RS-232 Buffer full. This occurs when the length of <br> the serial O message would overflow the local port <br> character buffer. The complete message is rejected. |
| N13 - N18 | Reserved for local control function errors. |

## Setup A

|  | Instruction |
| :--- | :--- |
| A Power-Up Clear | $>A U A()$ CR |
| Purpose: | Prevents the N00 or N09 Response message for the first instruction <br> received after power-up. This instruction does not affect operation or <br> setup. |
| Prerequisite: | None |
| Default: | None |
| Battery Backed: | If the Unit has the /M option installed, this instruction cancels the N09 <br> response. |
| Address: | Any master control, Master analog, Master Digital, or Digital <br> expander 1 address. |
| Caution: | This instruction only prevents the N00 or N09 response message. It <br> has no effect on operation or setup or any other function of this I/O <br> Plexer. |
| Remarks | Any other instruction returns an N00 or N09 response message. The |
| N00 Response tells the host that the power has been off and the I/O |  |

Example: This instruction prevents the N00or N09 response message from appearing after power is off when a message is sent to address 40 .

| Instruction | Response |
| :--- | :--- |
| $>40 \mathrm{AA} 5 \mathrm{CR}$ | ACR |

Instruction Content:

| $>$ | $=$ Start of Instruction |
| :---: | :--- |
| $\mathrm{AU}=40$ | $=$ Address |
| A | $=$ Function Code |
| $(\mathrm{O}=\mathrm{A} 5$ | $=$ Checksum |

Response Content:
$\mathrm{A}=$ Acknowledgment

## Setup B

|  | Instruction Response |
| :---: | :---: |
| B Reset | $>A U B() \mathrm{CR} \quad \mathrm{AcR}$ |
| Purpose: | Initializes analog or digital I/O configuration parameters for that I/O Plexer address to power up defaults. |
| Prerequisites: | None |
| Default: | None |
| Battery Backed | This instruction DESTROYS information saved by battery backed instruction Setup eF. |
| Address: | Any Master control, master digital, master analog, or digital expander 1 address. |
| Caution: | The I/O Plexer only resets the address it is sent to. For example, if it is sent to the digital expander 1 address, it does not reset the master digital address <br> This instruction has no effect on turn around delays configured by setup C |
| Remarks: | It affects various things depending on the address it is sent to. |
|  | Master Control Address: <br> - It does nothing except return an A |

Master Digital or Digital expander 1 address:

- Clears Latches, pulse counters, pulse duration, and pulse complete bits.
- Stops Squarewaves
- Clears output types
- Deactivates digital watchdogs
- Resets timer resolution multiplier (TRM) to 1
- All digital modules are seen as inputs
- Turns all outputs to Off

Master Analog Address:

- Stops all analog activity (waves etc...)
- Sets all analog outputs to zero scale
- Deactivates analog Watchdogs
- Stops averaging
- Clears averaging complete bit
- Clears temperature sensor types
- Offset set to zero and Gains set to 1
- All analog modules are seen as inputs

Example: $\quad$ Performs the reset instruction to the I/O Plexer address 40

| Instruction | Response |
| :--- | :--- |
| $>40 \mathrm{BA} 6 \mathrm{CR}$ | ACR |

Instruction Content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $A U=40$ | $=$ Address |
| B | $=$ Function code |
| ()$=\mathrm{A} 6$ | $=$ Checksum |

Response Content:
A = Acknowledgment

## Setup C

|  | Instruction | Response |
| :---: | :---: | :---: |
| C Turn around Delay $>L U \underline{\mathrm{C}} f() \mathrm{CR}$ |  | Acr |
| Purpose: | Provides the means fo response to an instruc | transmission of an I/O Plexer |
| Prerequisite: | None |  |
| Default: | No Delay ( $\mathrm{f}=0$ ) |  |
| Battery backed: | The underlined instru | ved in memory if: |
|  | 1) The I/O Plexer has AND | y Option |
|  | 2) Setup eF instruction desired. | the system is configured as |
| Address: | This can be sent to any affects all addresses a the master digital, ma | but it is a global instruction. It the master control address such as d the digital expander 1. |
| Remarks: | The turn-around delay | modem applications. |

Example:
This instruction sets up a 100 mSec turn around delay for all addresses associated with this chassis, including digital expander1.

| Instruction | Response |
| :--- | :--- |
| $>00 \mathrm{C} 2 \mathrm{D} 5 \mathrm{CR}$ | ACR |

Instruction content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $L U=00$ | $=$ Address |
| C | $=$ Function code |
| $\mathrm{f}=2$ | $=$ Turn around delay time selected from the f table below |

f Table

| Turn Around <br> Delay | $=$ No Delay | 10 mSec | 100 mSec | 500 mSec |
| :---: | :---: | :---: | :---: | :---: |
| Set f | $=0$ | 1 | 2 |  |

( ) = D5 =Checksum
Response Content:
A= Acknowledgment

## Setup F

|  | Instruction | Response |
| :--- | :--- | :--- |
| F Identify station type $>A U F($ )CR | A0z ( )CR |  |
| Purpose: | Identifies the function of the given address |  |
| Prerequisite: | None |  |
| Default: | None |  |
| Battery Backed: | Not applicable |  |
| Address: | Any Address |  | response indicates that it is a Master control address.

| Instruction | Response |
| :--- | :--- |
| $>00 \mathrm{FA} 6 \mathrm{CR}$ | A 0262 CR |

Instruction content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $A U=00$ | $=$ Address |
| F | $=$ Function code |
| ()$=$ A6 | $=$ Checksum |

Response: All possible responses are shown below:
A0060CR $=$ Digital Address
A0161CR $=$ Master Analog Address
A0262CR $=$ Master Control Address
The digital response means it is either a master digital address or a digital expander 1 address.

Setup G,H, I

| Instruction |  | Response |
| :---: | :---: | :---: |
| G Configure All modules | $>10 \underline{\mathrm{Ge}}$ ( ) CR | Acr |
| H Configure Inputs | $>\mathrm{IOHe}(\mathrm{CR}$ | Acr |
| I Configure outputs | $>\mathrm{IOI} \underline{\mathrm{I}}$ ( ) CR | AcR |

Purpose: Designate which module positions are to be inputs or outputs.
Prerequisite: None
Defaults: All module positions are designated as inputs
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

AND
2) Setup eF instruction is issued after the system is configured as
desired
Address: Any Master analog, master digital, or digital expander 1 address. It only configures one address at a time.

Caution: These instructions should always be issued first. If they are issued after other instructions have been sent everything in progress is stopped (Pulses, waveforms. delays etc...). It even clears all digital Z instructions from every module. We recommend the use of setup B and then reconfiguring if changes are needed.

This instruction configures modules 15 and 7 as outputs. All other positions are inputs.

Instruction Response
$>40 \mathrm{G} 80807 \mathrm{BCR} \quad$ AcR
Instruction content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $I 0=40$ | $=$ Address |
| G | $=$ Function code |
| $e=8080$ | $=$ Position field |

For setup G: 1's specify output modules 0 's specify input modules
For setup H: 1's specify input modules 0 's are disregarded
For setup I: 1's specify input modules 0 's are disregarded

If this field is omitted, FFFFH is assumed by the I/O Plexer.
Leading hex zeroes may be dropped, for more information refer to appendix A
( ) = 7B = Checksum
Response Content:
A = Acknowledgment

Setup j

| Instruction |  |
| :--- | :--- |
| j read module configuration | $>I 0 \mathrm{j}(\mathrm{OCR}$ |$\quad$| Response |
| :--- |
| $\operatorname{Ac}()_{\mathrm{CR}}$ |

Purpose: $\quad$| Returns current input/ output configuration. This is a good way to |
| :--- |
| verify your configuration done with setup G, H, and I |

Prerequisite: None

Default: None
Battery Backed: Not applicable
Address: Any Master digital, master analog. or digital expander 1 address. located at the I/O Plexer analog address 80 . The response from I/O Plexer indicates that modules in positions 3,4 , and 5 are analog outputs.

Instruction
$>80 \mathrm{jD} 2 \mathrm{CR}$
Instruction content:

| $>$ | $=$ Start of instruction character |
| ---: | :--- |
| $I 0=80$ | $=$ Address |
| j | $=$ Function code |
| $(\quad)=$ D2 | $=$ checksum |

Response
A0038CBCR

Instuction content.

Response Content:
A = Acknowledgment
$\mathrm{c}=0038=$ Position field. 4 hex digits are returned for each module specified in the instruction's position field. 1's indicate output modules, and 0's indicate analog input modules or digital modules. Values are returned from highest module (15) to lowest module (0).
()$=\mathrm{CB}=$ Checksum

## Setup E

Instruction
E Protocol -2 Pass >LUE0( )CR
E Protocol -4 Pass >LUE1( )CR

Response
Acr
ACR

Purpose: $\quad$ Selects communication protocol to be followed. 4 pass is intended for noisy communication environments and system debugging where accidental output changes could be dangerous.

Prerequisite: None
Default: Protocol type is permanently saved in the I/O Plexer. On power up the protocol is shown on the display. It is shipped in 2 pass.

Battery Backed: No affect, always saved
Address: Any address. This is a global instruction which affects all addresses associated with the master control address including the master digital, master analog, and the digital expander 1 address.

2 Pass:
Instruction is acknowledged and executed; response message is returned if incorrect. The possible responses are shown below.

| Host | I/O Plexer |
| :--- | :--- |
| Valid non-data instruction | ACR |
| Valid data instruction | A (DATA) ( )CR |
| Faulty instruction | N (Response Code)CR |

## 4 Pass:

Host transmits the instruction; I/O Plexer echoes it but does not execute it; host returns ECR if the echo is correct.; the I/O Plexer then performs the instruction. If any character other than an E is returned to the I/O Plexer the instruction is cancelled.

| Host: | I/O Plexer: |
| :--- | :--- |
| Instruction | A (Echo instruction)CR |
| ECR | ACR |
|  | OR |
|  | A(data)( )CR |
|  | OR |
|  | A(Response Code $) \mathrm{CR}$ |

A list of response codes can be found on page 3-12

| Instruction | Response |
| :--- | :--- |
| $>00 \mathrm{E} 1 \mathrm{D} 6 \mathrm{CR}$ | ACR |

Instruction content:

$$
\begin{array}{ll}
> & =\text { Start of instruction character } \\
00 & =\text { Address } \\
\text { E1 } & =\text { Function code for } 4 \text { pass } \\
()=\text { D6 } & =\text { checksum }
\end{array}
$$

Response content:
A $=$ Acknowledgment

Example2: Instructs the I/O Plexer at address 00 and all associated addresses to use 2 pass. This instruction is executed in 4 pass.

## Communication Watchdog

Instruction Response

| D Watchdog Position delay - Digital | $>D D \underline{\mathrm{D} c g( }) \mathrm{CR}$ | ACR |
| :--- | :--- | :--- |
| m Watchdog Position/ delay-Digital | $>D D \underline{\mathrm{~m} c n}() \mathrm{CR}$ | ACR |
| D Watchdog Position/ delay -Analog | $>M A \underline{\mathrm{D} c g}() \mathrm{CR}$ | ACR |
| m Watchdog Position/ delay -Analog | $>M A \underline{\mathrm{~m} c \ldots l() \mathrm{CR}}$ | ACR |
| eD Watchdog multiplier - Enable | $>M C \underline{\mathrm{eD}() C R}$ | ACR |
| dD Watchdog multiplier -Disable | $>M C \underline{\mathrm{dD}}() \mathrm{CR}$ | ACR |

Purpose: The watchdog delay instructions cause the I/O Plexer to go to a specified state if no instructions are received from the host for a specified period of time. This instruction is good for switching to emergency or standby status at the I/O Plexer in the event that the host can no longer control it.

Prerequisite: For any watchdog instruction to affect an output, it must be configured as an output using setup G or I.

Defaults: Watchdog is inactive
Battery backed: The underline instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

OR
2) Setup eF instruction is issued afer the system is configured as desired. time out with a N06 response message and the instruction not executed.

There is a separate watchdog for each digital and analog address. Digital expander 1 is separate from the master digital address. When a failure occurs, all modules at that address are set. Module positions not explicitly given other values are set to zero.

Setup eD allows the delay to be multiplied by 256 to provide longer delays

The programmable communication watchdog delay instructions should not be confused with I/P Plexer's hardware watchdog. The hardware watchdog acts automatically in the event of a hardware or firmware failure and responds within 1 second. The hardware watchdog turns all outputs off, and locks the I/O Plexer. The hardware can only be reset by recycling power. The middle horizontal bar of the display is on continuously when a hardware watchdog time out occurs.

## Setup D (Digital Watchdog)

Example: If ther is no serial communication for 1minute, this instruction activates output module 0 and deactivates all other digital outputs at address 43 .

Instruction Response
$>43 \mathrm{D} 6 \mathrm{E} 1$
ACR
Instruction content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $D D=43$ | $=$ Address |
| D | $=$ Function code |
| $\mathrm{g}=6$ | $=$ Time/ Action field from table below |

Values for g can range from 0-7, all others return N08 response.

| g | Time | $\underline{\text { Action }}$ |
| :--- | :--- | :--- |
| 0 |  | Watchdog Disable |
| 1 | 10 Seconds | Turn all digital output modules off |
| 2 | 1 Minute | Turn all digital output modules off |
| 3 | 10 Minutes | Turn all digital output modules off |
| 4 |  | Watchdog Disable |
| 5 | 10 Seconds | Turn module 0 on, all others off |
| 6 | 1 Minute | Turn module 0 on, all others off |
| 7 | 10 Minutes | Turn module 0 on, all others off |

If this field is omitted, $\mathrm{g}=0$ is assumed and the watchdog is disabled.
( ) = E1 = Checksum
Response Content:
A = Acknowledgment

## Setup m (Digital Watchdog)

m Watchdog Position/ Delay -Digital $>D D \operatorname{mcn}(\mathrm{OR}$ | Instruction ACR |
| :--- |
| Purpose: |
| Addressing: |
| Remarks: |
| Allows the user to specify individual states for the digital modules |
| when the serial communication watchdog times out. |

Example: Instructs the I/O Plexer at address 41 to turn modules 15 and 0 on and disable others if there is no communication with the digital address for 2 seconds (WDM 1)

| Instruction | Response |
| :--- | :--- |
| $>41 \mathrm{~m} 8001 \mathrm{C} 816 \mathrm{CR}$ | ACR |

Instruction content:

| $>$ | $=$ Start of instruction character |
| :--- | :--- |
| $D D=41$ | $=$ Address |
| m | $=$ Function code for 4 pass |
| $\mathrm{C}=8001$ | =position field. 1's correspond to outputs on. 0 's <br> correspond to outputs off. For more information refer to <br>  <br> Appendix A. |
| $\mathrm{n}=\mathrm{C} 8$ | $=$ Time delay. Delay $\mathrm{H}=($ desired delay seconds $/(.01$ |
|  | *WDM $) \mathrm{H}$ convert 1 to 4 hex digits. |

Response Content:
$\mathrm{A}=$ Acknowledgment

## Setup D (Analog Watchdog)

|  | Instruction | Response |
| :--- | :--- | :--- |
| D watchdog position/ Delay -Analog | $>M A \operatorname{Dcg}() \mathrm{CR}$ | ACR |

Purpose: $\quad$ Setup D (Analog ) sets up the time delay and can set modules to zero or full scale when a serial watchdog failure occurs. If used in conjunction with Setup m (analog), it can set up levels other than zero and full scale when a serial watchdog occurs.

Address: Any master analog address
Caution: $\quad$ For $g=0-7$ the table presented overrides any values previously set by setup $m$ (analog).

Reference: For general information on communication watchdogs, refer to the watchdog introduction section.

Example: $\quad$ Instructs the analog address 83 to output full scale to module 0 and 7 if there is no activity on the analog address line for 10 seconds.

| Instruction | Response |
| :--- | :--- |
| $>83 \mathrm{D} 00815 \mathrm{ADCR}$ | ACR |

Instruction content:

| $>$ | $=$ Start of instruction character |
| :--- | :--- |
| 83 | $=$ Master Analog Address |
| D $=0081$ | $=$ Function Code |
| $\mathrm{c}=$ | = Position field. 1's specify which modules are to be <br> affected. 0's are disregarded. For more information refer to <br> appendix A |

Values for $g$ can range from $0-7$ or $14 \mathrm{H}-\mathrm{FFFFH}$

| g | Time | Action |
| :--- | :--- | :--- |
| 0 | Disable |  |
| 1 | 10 Seconds | Write Zero scale |
| 2 | 1 Minute | Write Zero scale |
| 3 | 10 Minutes | Write Zero scale |
| 4 | Disable |  |
| 5 | 10 Seconds | Write full scale |
| 6 | 1 Minute | Write full scale |
| 7 | 10 Minutes | Write full scale |

If setup $m$ is used, setup $D$ configures the time delay and setup $m$ specifies the output levels.
Delay $=(0.01$ seconds $* W D M)$ H Convert 1 to 4 hex digits.
Delays of less than 200 mSec 14 H are not accepted and return a N07 response message.

If no delay is given, the watchdog is disabled
If WDM is in effect, all of the above times are multiplied by 256.
( ) = AD = Checksum
Response Content:

$$
\mathrm{A}=\text { Acknowledgment }
$$

## Setup m (Analog Watchdog)

| Instruction | Response |
| :---: | :---: |
| m Watchdog Position/ levels $>$ Analog) $_{\text {(Anc. . }}(\mathrm{l}) \mathrm{CR}$ | ACR |

Purpose: Setup m must be used in conjunction with setup D (Analog). Setup D determines the delay period and setup $m$ determines the output levels the analog outputs go to when a serial communication watchdog failure occurs.

Address: Any master analog address.
Caution: All analog modules that are not given a specific level are set to zero scale.
If in setup D (analog) $\mathrm{g}=0-7$, then any previous levels set by setup m are ignored.

Reference: For general information on communication watchdogs, refer to the watchdog introduction section.

Example: $\quad$ Instructs the I/O Plexer at address 81 to output the value $800 \mathrm{H}(1 / 2$ scale) to analog output module 12 and the value FFFH (Full scale) to module 7 , if a serial watchdog timeout occurs.

| Instruction | Response |
| :--- | :--- |
| $>81 \mathrm{~m} 1080800 \mathrm{FFF} 09 \mathrm{CR}$ | ACR |

A $=$ Acknowledgment

## Setup eD, dD (Watchdog)

|  | Instruction | Response |
| :--- | :--- | :--- |
| eD Watchdog multiplier - Enable | $>M C \underline{\mathrm{eD}() \mathrm{CR}}$ | ACR |
| dD Watchdog multiplier - Disable | $>M C \underline{\mathrm{dD}}()_{\mathrm{CR}}$ | ACR |

Purpose: $\quad$ This instruction allows the watchdog delay time to be multiplied by 256. This extends the maximum watchdog delay time from 10.9 minutes to 46.6 hours.

Prerequisite: None
Defaults: $\quad$ Watchdog multiplier $=1$
Battery backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

AND
2)Setup eF instruction is issued after the system is configured as
desired.
Address: Any master control address
Remarks: This affects all communication watchdogs both analog and digital.
When this instruction is enabled, WDM $=256$

Example: This instruction enables the watchdog multiplier at all addresses connected to this master control address. This means that any time a 1 second delay is sent using setup D or m it is multiplied by 256 for an actual delay of 256 seconds.

| Instruction | Response |

Example: Disables Checksum tag
Instruction
Response
$>00 \mathrm{dC} 07 \mathrm{CR}$
A * ( ) * CR

Setup eE, dE
Instruction
$>M C$ eE ( )CR
Acr
eE Enable Error messages
dE Disable Error messages
$>M C$ dE( )CR

Purpose: Provide the means for disabling the return of error messages that the host software may not be able to handle.

Prerequisites: None
Default: Error message enabled
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

AND
2) Setup eF instruction is issued after the system is configured as desired.

Address: Master Control address only. but this is a global instruction. It affects all addresses associated with this master control address such as master digital, master analog, and the digital expander 1.

Caution:
There is NO response when an error occurs. This condition may cause the host to wait indefinitely for a response that will never be issued.

Example: Disables error messages

| Instruction | Response |
| :--- | :--- |
| $>00 \mathrm{dE} 009 \mathrm{CR}$ | ACR |

Instruction content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $M C=00$ | $=$ Master Control Address |
| dE | $=$ Function code |
| $(\mathrm{O}=09$ | $=$ checksum |

Response Content:
A $=$ Acknowledgment

| eF Save Setup | $>M C \underline{\mathrm{eF}}() \mathrm{CR}$ | ACR |
| :--- | :--- | :--- |
| dF Disable Setup | $>M C \underline{\mathrm{dF}}() \mathrm{CR}$ | ACR |

Purpose: Allows the configuration information to be saved in battery backed RAM, while power is off. Must have /M option.

Prerequisite: None
Default: Disable
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option AND
2) The eF instruction is issued after the system is configured as desired.

Address: Master Control address only, but this is a global instruction. It affects all addresses associated with this master control address such as the master digital, master analog, and the digital expander 1.

Remarks: When setup eF instruction is sent, the I/O Plexer calculates and stores a checksum of the configuration data. During power up a new checksum is computed. If it agrees with the stored one, the system is configured as it was before the power cycle. If they do not agree, the system is initialized to the default state as if there was no battery backup.

Changing the configuration after issuing setup eF changes the checksum. After all changes, setup eF must be re-issued to save the configuration.

Example This instruction saves the system configuration as it is at the time it was sent.

| Instruction | Response |
| :--- | :--- |

## Setup a, b

a set Variable Address

| Default: | Offset addressing automatically sets the addresses based on the Master <br> Control address. It is shown below. |
| :--- | :--- |
| Master digital address | $=40 \mathrm{H}+$ Master Control address |

Offset addressing allows setting the master control address to any value from 00 H to 3 Fh . Using setup a allows any address to be set to any value from 00H to FFh.

Caution: This instruction can also reset the Master control address. Once changed, the new Master control address is required to change it back. Powering down will not bring it back in its previous state.

Battery Backed: No effect, always saved
Address: Any master control address
Example: $\quad$ This requests the addresses associated with master control. 00 H

| Instruction | Response |

## DIGITAL INPUT INTRODUCTION

PICTORIAL GLOSSARY
Digital a, b, c

Digital e,f

Time $n$ is collected. Only the first pulse is measured. It must be reset to measure another pulse.

1

2

3
N

Pulse duration measurement with Accumulator option and positive edgetriggering produces the following results:
$n \mathrm{~T}=n 1+n 2+n 3$
$n \mathrm{~T}=$ Total On time accumulated over all pulses

Digital W, X, Y, U, V, T

Pulse counter counts the number of pulses

> Digital N, O, P, Q, R, S

## Off to On

|  | Instruction | Response |
| :--- | :--- | :--- |
| $M$ Read all modules | $>D D M() \mathrm{CR}$ | AcCR |

Purpose: Determines the on/ off state of all digital I/O positions, both input and output.

Prerequisite: $\quad$ Configure as inputs using step G or H
Default: None
Battery Backed: Not applicable
Address: Any master digital or digital expander 1 address.
Caution: The instruction does NOT read the physical output at the terminal strip, but the actual value last sent by the I/O Plexer.

Example:
This instruction reads the status of all digital modules. The response indicates that the module 4 and 5 are on.

| Instruction | Response |
| :--- | :--- |
| $>40 \mathrm{MB} 1 \mathrm{CR}$ | A 0030 C 3 CR |

Instruction Content:

| $>$ | - start of instruction character |
| :---: | :--- |
| $D D=40$ | - Digital address |
| M | - function code |
| $(\mathrm{y}=\mathrm{B} 1$ | - Checksum |

Response Content:

## A - Acknowledgment

$\mathrm{c}=0030 \quad$ - Position Field, 1's mean the module is on, 0 's mean they are off. The modules can be inputs or outputs. For more information refer to appendix A
$\left(\begin{array}{l}\text { ) }=\text { C3 }\end{array} \quad\right.$ - Checksum

Digital a, b, c

|  | Instruction | Response |
| :--- | :--- | :--- |
| a Set All triggers edges | $>D D \underline{\mathrm{a} e}(\mathrm{OR}$ | ACR |
| b Set Positive trigger edges | $>D D \underline{\mathrm{~b} e}($ )CR | ACR |
| c Set Negative trigger edges | $>D D \underline{\mathrm{c} e}($ )CR | ACR |

| Purpose: | Set triggers edges for pulse duration measurements. Digital a can be <br> used if all inputs are to have a duration measurement, otherwise |
| :--- | :--- |
| Digital $b$ and c should be used. |  |

Prerequisites: These instructions should be used before duration counter instructions, digital $\mathrm{d}, \mathrm{e}$, and f

Default: Negative trigger edges
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the / M memory option

AND
2) Setup eF instruction has been issued after the system is configured as desired.

Address: Any master digital or digital expander 1 address
Remarks: Positive trigger edge is for off on off pulse. Negative trigger edge is for on off on pulses.

Example:
Modules 4 and 5 are set to measure positive trigger edges.
Instruction
Response
$>40 \mathrm{~b} 003089 \mathrm{CR}$
Acr

Instruction content:

| $>$ | $=$ Start of instruction character |
| :---: | :--- |
| $D D=40$ | $=$ Digital Address |
| b | $=$ Function code |
| $\mathrm{e}=0030$ | $=$ Position field |

Digital a 1's set positive trigger edges
0's set negative trigger edges
Digital b 1's set positive trigger edges
0's are disregarded
Digital c 1's are negative trigger edges
0's are disregarded

If this field is omitted, FFFFH is assumed by the I/O Plexer. Leading hex zeroes may be omitted. For more information, refer to appendix A.
( ) = $89=$ Checksum
Response content:
$\mathrm{A}=$ Acknowledgment

Digital d

|  | Instruction | Response |
| :--- | :--- | :--- |
| d Measurement complete | $>D D \mathrm{~d}(\mathrm{)CR}$ | $\mathrm{Ac}(\mathrm{)} \mathrm{CR}$ |

Purpose: Determines which positions have completed full pulse duration

Prerequisites: Set the duration trigger edges using the digital $\mathrm{a}, \mathrm{b}$, or c instruction. Initialize duration counters to zero with the digital $f$ or $g$ instruction.

Default: Configure as inputs using setup G or H
Battery backed: Not applicable
Address: $\quad$ Any master digital or digital expander 1 address.

| Remarks: | A measurement complete bit is set to indicate entire pulse has been <br> gathered. The host can read this bit to see if measurements are <br> complete and then read the duration counters. No other durations will <br> be measured until complete bit is cleared. |
| :--- | :--- |

If the pulse duration is read (Digital e and f) before the pulse had finished, the partial duration is returned.

The measurement complete bit is cleared whenever digital f or g is issued, to clear pulse duration.

Caution: These instructions are affected by the setup n instruction, which can adjust the timer resolution multiplier, TRM.

If pulse accumulator, digital $y$, is used the measurement complete set bit is never set.

Example: This instruction asks which modules have completed a pulse duration measurement. The response indicates that module 4 has completed it.

| Instruction | Response |
| :--- | :--- |
| $>40 \mathrm{dC} 8 \mathrm{CR}$ | A0010C1CR |

Instruction content:

$$
\begin{array}{cl}

\end{array}
$$

Response Content:

$$
\begin{array}{cl}
\text { A } & =\text { Acknowledgment } \\
\mathrm{C}=0010 & \begin{array}{l}
\text { = Position field. The 1's bits have completed their } \\
\text { specified off on off, or on off on sequence. 0's have not } \\
\text { completed transition or are not digital inputs }
\end{array} \\
(\mathrm{O}=\mathrm{C} 1 & =\text { checksum }
\end{array}
$$

## Digital e, f, g

|  | Instruction | Response |
| :---: | :---: | :---: |
| e Read Duration Counters | $>$ DDee( ) CR | A. . . $n($ ) CR |
| f Read and Clear Counters | $>D D f e() \mathrm{CR}$ | A. . . $n($ ) CR |
| g Clear Duration Counters | $>D D \mathrm{ge}(\mathrm{)CR}$ | Acr |

Purpose: $\quad$ Reads and /or clears pulse duration counters. When a pulse duration measurement is complete, the value is stored for the host to read. Another pulse will not be measured until this measurement is cleared. Digital f is the equivalent of the combination of Digital e and g .

Prerequisites: Duration counters must be setup using $\mathrm{a}, \mathrm{b}$, or c . Then set counters to zero with a clear instruction, digital $f$ or $g$

Default: Configure as inputs using setup G or H
Battery backed: Not applicable
Address: Any master digital or digital expander 1 address.
Remarks: If the pulse duration is read before the pulse has finished, the current partial duration is returned.

The clear instruction also clears the measurement complete bits that are set.

Maximum count is 65,535 or FFFFH. If this number is reached the counter rolls over and continues counting. This occurs at 10.9 minutes to 46.6 hours depending on the value of TRM.

Caution: If pulse accumulation is being used (digital y) accumulated durations are read. Otherwise only the first pulse is measured. These instructions are affected by the setup n instruction which can adjust the timer resolution multiplier (TRM)

Example: $\quad$ This instruction requests the duration for modules 4 and 5. Module 5 has a duration of 3.23 seconds and module 4 has a duration of 2.4 seconds assuming TRM $=1$.

Digital y, z

Instruction
$\begin{array}{lll}\text { y Pulse Accumulator -enable } & >D D y e(\text { )CR } & \text { ACR } \\ \text { z Pulse Accumulator - Disable } & >D D z e(\text { )CR } & \text { ACR }\end{array}$

Purpose: $\quad$ This instruction is related to the instruction set of Digital a through Digital g. It allows the duration counter to accumulate the total pulse width of a train of pulses rather than just one pulse.

Prerequisite: $\quad$ Digital $\mathrm{a}, \mathrm{b}$, or c must be used to set up the trigger edges. Digital e, f, and/ or g may be used to read and or clear the duration.

Default: Disabled
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

AND
2) Setup eF instruction is issued after the system is configured as
desired.

Address: Any master digital or digital expander 1 address.
Caution: Pulse complete bits (Read with digital d) are never set for positions modified by Digital y.

Example: $\quad$ This instruction enables pulse accumulation at module 8 and 5.

Digital N, O, P
Instruction Response

| N Set All Latch Edges | $>D D \underline{\mathrm{Ne} e}() \mathrm{CR}$ | ACR |
| :--- | :--- | :--- |
| O Set Latches Off to On | $>D D \underline{\mathrm{Oe}(~) \mathrm{CR}}$ | ACR |
| P Set Latches On to Off | $>D D \underline{\mathrm{Pe}(~) C R}$ | ACR |

| Purpose: | Sets up latch edges for On to Off or Off to On transitions. The Digital |
| :--- | :--- |
| N instruction affects all input positions. |  |

Prerequisites: $\quad$ Configure as inputs using Setup G or H.
Default: Latch Off to On transitions.
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

AND
2) Setup eF instruction is issued after the system is configured as
desired.

Address: Any master digital or digital expander 1 address.
Remarks: Latches are set only when the specified transition occurs. Once a latch is set it will not change until a clear instruction Digital S or R resets the transition detecting latch.

Example: This instruction sets modules 4 and 5 to latch On to Off. The rest of the modules latch Off to On.

## Digital Z

|  | Instruction | Response |
| :--- | :--- | :--- |
| Digital Z Modifiers |  |  |
| One Shot On $>D D \operatorname{ZeH} n(\quad) \mathrm{CR}$ |  | ACR |
| One Shot Off | $>D D \operatorname{ZeJ} n(\mathrm{)CR}$ | ACR |
| Terminate | $>D D \operatorname{ZeG}(\mathrm{OR}$ | ACR |

Purpose: Produces an output that when turned On/Off stays in that state for the specified time period and then returns to its initial state.
When the one shot is no longer wanted it can be terminated using digital Z. . G

Prerequisite: Configure module positions as output using Setup G or I instruction.
Defaults: Modifiers disabled

Battery Backed: The underlined instruction data is saved in memory if :

1) The I/O Plexer has the /M memory protect option

AND
2) Setup eF is issued after the system is configured as desired.

Address: Any master digital or digital expander 1 address.
Caution: These instructions are affected by setup n , which adjusts the timer resolution multiplier, TRM. If a module is set for a one shot on, it has no affect turning it off.

The time delay is restarted when Digital J, K, or L resend the data which started the delay. Digital h does the same thing. These instructions are ONLY modifiers and do not turn any modules On or Off. It performs its function only after Digital J, K, or L is sent. Terminating the instruction (Digital Z . .G) returns the output to normal behavior and turns the module Off.

Example: $\quad$ This instruction directs the I/O Plexer at address 40 to set module 2 for one shot On (off ON off). transition. The period for the On time is 00 C 8 H or 2 seconds if TRM $=1$.

| Instruction | Response |

Instruction Response

Digital Z Modifiers
Delayed On
Delayed Off
Terminate

| $>D D$ Zeln $($ ) CR | Acr |
| :---: | :---: |
| $>D D \underline{\mathrm{ZeK} n}(\mathrm{)cR}$ | Acr |
| $>D D Z e \mathrm{G}() \mathrm{CR}$ | AcR |

Purpose: Puts in a time delay before the module is turned Off or On. If the delay is no longer desired it can be terminated by Digital Z. . . G

Prerequisite: $\quad$ Configure as output using setup G or I instruction.
Defaults: Modifiers Disabled
Battery Backed: The underlined instruction data is saved in memory if :

1) The I/O Plexer has the /M memory protect option

AND
2) Setup eF is issued after the system is configured as desired.

Address: Any master digital or digital expander 1 address.
Caution: These instructions car affected by setup n, which adjusts the timer resolution multiplier, TRM. The time delay starts over whenever digital h is sent or Digital J, K, or L. If a module is setup for delay On, there is no delay in turning it Off.

These instructions are ONLY modifiers and do not turn any modules on/ off.
It performs its function only after digital $\mathrm{J}, \mathrm{K}$, or L is sent. Terminating the instruction (Digital Z. . .G) return the output to normal behavior and turns the module off.

```
Example This instruction sets up module 0 to have a delayed On of 2 seconds assuming TRM=1
```

## Digital k, I

Instruction Response

| k Start pulse On | $>D D \mathrm{kcn}()_{\mathrm{CR}}$ | ACR |
| :--- | :--- | :--- |
| $\ell$ Start pulse Off | $>D D \operatorname{lcn}()_{\mathrm{CR}}$ | ACR |

Purpose: Turns specified modules On or Off for a specified period of time.
Prerequisite: Configure as digital outputs using Setup G or I instruction.
Default: None
Battery Backed: Not applicable
Address: Any master digital or digital expander address
Caution These instructions are affected by the setup n, which adjusts the timer resolution TRM.

Remark: These instructions care similar to one shot waveforms Digital Z. . H and Z . . J, except this actually performs the instruction when it is sent. Furthermore, they do not modify the behavior of the normal digital J, K , and L. Digital Z is a modifier which performs its task only when the module is turned $\mathrm{On} / \mathrm{Off}$.

Once started, a pulse may be terminated early by issuing a digital output instruction (Digital J, K, L, i, k, l) Do not use retrigger time delay, Digital h with Digital k ir 1.

Example:
This instruction turns module 13 and 5 On a for period equivalent to 01 F 4 H or 5 seconds assuming $\mathrm{TRM}=\mathrm{M}$.

## ANALOG INPUT INTRODUCTION

Analog input modules range is divided into 4095 segments - 12 Bit resolution. The values are represented by 4 hex digits. The first hex digit is the "range" digit. If it is a 1 , the reading is in range. The I/O Plexer handles values from 0 F 00 H to 2 BFFh . The module its self may not be able to generate values to the high and low end of this scale. There is NO guarantee of accuracy for values outside of 1000 H to 1 FFFH range If the module reads a value that is outside of the range it will report 000 H or 3000 H depending if its over or under scale. If an analog output or a digital module is interrogated, ???? are returned.

| 0000 H <br> 0 F 00 H | Low value default |
| :--- | :--- |
| 1000 H | * repeatable |
| 1 FFFH | valid in-range value |
| 2 BFFH | * Repeatable |
| 3000 H | High value default |

[^0]Caution 1: If an analog output module is installed but not configured as an output by the use of Setup G or I, it indicates 3000 H not???

Caution 2:
If an analog input is mistakenly configured as an analog output, it returns whatever value was last sent to the output module.

## PICTORIAL GLOSSARY

analog $\mathrm{g}, \mathrm{h}, \mathrm{W}$
Applying calculated offsets to analog inputs

Analog X, Y, and Z
Applying calculated gains to analog input

Applying both calculated gains and offsets to analog inputs simultaneously

Frequently, analog sensors and analog input modules do not exactly match where voltages and currents are concerned. The common correction for this phenomena is known as calibration. Since analog voltage and current can sometimes be difficult to adjust, the I/O Plexer contains the ability to "correct" the analog data using host defined mathematical gains and offsets. An alternate method to using host specified values is the practice of physically changing the desired sensor output to the real zero or full-scale value then issuing the calculate and set command for offset or gain respectively. Using this method, system calibration can be performed quickly and efficiently.

This instruction may be used for triggering alarms or capturing data where response needs to be faster than the host to I/O Plexer network serial link can react. Using this feature, very fast events can be recorded for the host to review after the event has occurred. The reaction speed of the I/O Plexer varies depending upon the number of analog input channels installed in the system.

Analog L

|  | Instruction | Response |
| :--- | :--- | :--- |
| L Read Input | $>M A L e(~) C R$ | A. . .k( )CR |

| Purpose: | Determines the magnitude of analog inputs |
| :--- | :--- |
| Prerequisite: | Configure as input using Setup G or H |
| Default: | None |
| Battery Backed: | Not Applicable |
| Address: | Any Master analog address |
| Remarks | Response values include the effects of offset and gain instructions <br> Caution: |
|  | Unconnected analog input modules may result in unpredictable <br> readings. |

Instruction Response
$>80 \mathrm{~L} 200177 \mathrm{CR}$

Response
A1A291089AFCR

Instruction content:

## Analog g, h

Instruction Response
g Calculate Offset $\quad>$ MAge ( ) CR
h Calculate \& Set Offset $\quad>M A \underline{h e}() \mathrm{CR}$
A..$k()_{\mathrm{CR}}$
A..$k() \mathrm{CR}$

Purpose: Analog g and h calculate and/ or set a constant offset which is added to an input before sending a value to the host. This is generally used to compensate for sensor offsets - Zero adjustment.

Prerequisite: $\quad$ Configure as input using setup G or H
Default: $\quad$ Offset $=0000 \mathrm{H}$
Battery Backed: The underlined instruction data is saved in memory if:

1) the I/o Plexer has the / M memory protect option

AND
2) Setup eF is issued after the system is configured as desired.

Address: Any master analog address
Remarks: It is recommended that the user keep the offset in the range $-100 \%$ to $+8 \%$ of the module range.

Use of large offsets may reduce the usable range of a nodule.
This instruction should be used wen the specified module is at the desired zero scale and the gain $=1$

Caution: Do not use this instruction with temperature inputs

Instruction content:

| $>$ | $=$ Start of instruction character |
| :--- | :--- |
| $M A=80$ | $=$ Master analog Address |
| $e=2001$ | = Position field. 1's select which modules have an offset <br> calculated, 0's are disregarded. If this field is omitted, the |
|  | I/O Plexer assumes a value of FFFFH. Leading hex <br> zeroes can be omitted. For more information see appendix <br> A |
| $\left(\begin{array}{ll}\text { A }\end{array}\right.$ |  |
|  | $=$ Checksum |

Response Content:

| A | $=$ Acknowledgment |
| :---: | :--- |
| $\mathrm{k}=$ F5E70003 | Response data, 4 hex digits are returned for each module |
| position specified in the instructions position field. Values |  |
| are returned from highest (15) to lowest (0). If $? ? ? ?$ is |  |
| returned, an analog output or digital module was |  |
| interrogated. Negative offsets are represented as any |  |
| number with a non-zero first hex digit of F |  |
| F5E7H is module 13 negative offset |  |
| 0003H is Module 0 positive offset |  |
| For more information on analog input conversions, refer |  |
| to appendix C |  |

Instruction Response

W Set Offsets
$>M A \underline{W c . . k(~) C R}$
ACR
Purpose: Adds a specified constant offset to an input before transmission to host.

Prerequisite: $\quad$ Configure as input using setup G or H
Default: $\quad$ Offset $=0000 \mathrm{H}$
Battery Backed: The underlined instruction data is saved in memory if:
1)The I/O Plexer has the /M memory protection option AND
2)Setup eF is issued after the system is configured as desired

Address: Any master analog address
Remarks: We recommend the user keep the offset in a range of $-100 \%$ to $+8 \%$ of the module range.

Use of large offsets may reduce the usable range of a module.
Caution: Do NOT use this instruction with temperature inputs an offset of FFAEH.
Instruction Response
>80W20010051FFAE5ACR ACR

Instruction content:
\(\left.\begin{array}{ll}> \& =Start of instruction character <br>

## Analog X, Z

|  | Instruction | Response |
| :--- | :--- | :--- |
| X calculate Gain | $>M A X e)($ )CR | $\mathrm{A} . k \mathrm{CR}$ |
| Z Calculate and set gains | $>M A \underline{Z e}() \mathrm{CR}$ | $\mathrm{A} . k \mathrm{cR}$ |

Purpose: $\quad$ Multiplies an analog input's value by a constant before transmission to host. This is generally used for sensor range span adjustment.

Prerequisite: $\quad$ Offsets, if desired must be applied before using these instructions.
Default: $\quad$ Gain $($ slope $)=1(k=1000 \mathrm{H})$
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory protect option AND
2) Setup eF is issued after the system is configured as desired.

Address: Any master analog address
Remarks: Gains can range from $0.25(0400 \mathrm{H})$ to $4(4000 \mathrm{H})$
Gain (slope) instructions along with the offset instructions make it possible for an input to be adjusted to "Fill" the entire1000H to 1 FFFH range

Gains larger than 1 result in lowered resolution
Special response N07 is returned if a gain is out of range
Caution: Do not use this instruction with temperature inputs

Instruction
$>M A \underline{N c l m}() \mathrm{CR}$

Response
Acr

Purpose: $\quad$ Sets high and low range limits for specified analog inputs. If the actual analog input is above or below the specified range limit, a corresponding latch is set. This does not affect the value of the analog input.

Prerequisite: $\quad$ Configure as input using setup G or H
Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory protect option

AND
2) Setup eF is issued after the system is configured as desired.

Address: Any master analog address
Default: $\quad$ Range limits are active. High range limit $(l)=$ FFFH and the low range limit $(m)=000 \mathrm{H}$

Remarks:
Outside of range latches remain set until a clear or reset instruction.
Gain and offset instructions are applied before range limit checking occurs

Caution:
Analog N range limits $l$ and m consist of 3 hex digits ranging from 000 H to FFFh. These correspond to input module readings of 1000 H to 1 FFFн.

Example: $\quad$ This instruction sets a high range of C 00 H and a low range of 400 H to module 9 and module 0 .

## Analog M

|  | Instruction | Response |
| :--- | :--- | :--- |
| M read and average | $>M A M b j(~) \mathrm{CR}$ | $\mathrm{A} k()_{\mathrm{CR}}$ |

## NOT RECOMMENDED!!! USE Analog T, i, U

| Purpose: | Provide average value of single I/O Plexer module position over a <br> specified number of samples |
| :--- | :--- |
| Prerequisite: | Configure as an input using Setup G or H |
| Default: | Averaging inactive |
| Battery Backed: | Not applicable |
| Address: | Any master analog address |
| Remarks: | Sample time $=(10 \mathrm{mSec} *$ number of analog inputs installed on <br> board $)$ |
| Formula: | Average $=($ Sum of j readings $) / \mathrm{j}$ |
| Caution: | The analog M instruction accumulates samples only while the user <br> waits, and waits-and waits. The I/O Plexer can receive no more <br> instructions until averaging is complete. Furthermore no response is |
| sent to the host, therefore the host is tied up until the average is |  |
| computed also. |  |

Example:
This instruction averages the next 240 samples for module 10. The response indicates an average of 1580 H
Instruction Response
>80MAF06CCR
A1580CECR
Instruction content:

## Analog U

|  | Instruction | Response |
| :--- | :--- | :--- |
| U Read Averaged Inputs | $>M A U e() \mathrm{CR}$ | $\mathrm{A} . . k(\mathrm{CR}$ |

Purpose: | Provide the average value of a number of sequential samples of analog |
| :--- |
| inputs for the specified modules as determined by the Analog T and i |
| instruction. |

Prerequisite: $\quad$ Averaging must be started by the use of analog T instruction.
Default: Averaging inactive
Battery Backed: Not applicable
Address: Any master analog address
Remarks: $\quad$ Sample time $=(10$ milliseconds $*$ number of analog inputs on board $)$
If analog U instruction reads an average before analog i indicates the total number of samples have been accumulated, it provides the correct average for the number of samples already taken. However the number of samples used in this calculation can not be obtained.

Analog U will keep reading the last average until analog T is reissued.

Example:
This example reads the average of module 13 and module 0 at analog address 80
Instruction Response
$>80 \mathrm{U} 200180 \mathrm{CR}$

Analog K

|  | Instruction | Response |
| :--- | :--- | :--- |
| k Set Temperature Sensor Type | $>M A \underline{\mathrm{k} c x}(\mathrm{CR}$ | ACR |

Purpose: This instruction defines the type of temperature modules installed so that the I/O Plexer firmware can linearize the signal and output a temperature in ${ }^{\circ} \mathrm{C}$ to the host when asked.

Prerequisite: $\quad$ Configure as an input using setup G or H
Default: None

Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory protect option AND
2) Setup eF is issued after the system is configured as desired.

Address: Any master analog address.
Remarks: Cold reference compensation and linearization is taken care of at the module location. The user needs to convert the number to decimal and divide by 16 for a correct temperature reading.

## Example:

This instruction sets up modules $4,5,9$, and 12 as type J
thermocouple.
Instruction Response

## ANALOG OUTPUT INTRODUCTION

Purpose: $\quad$ To send specific output values or timed waveforms to the hardware.

Resolution:

Caution:

Analog outputs have 12 bit resolution. Their data is stored in 3 hex digits from $0(000 \mathrm{H})$ to 4095 (FFFH).

Field side circuitry may affect the actual output values of analog modules.

## WAVEFORM INTRODUCTION

Analog R, V

| Purpose: | Output analog signals whose amplitudes change with time. |
| :--- | :--- |
| Prerequisite: | Configure as outputs using setup G or I |
| Default: | Instructions inactive |
| Battery Backed: | Not applicable |
| Address: | Any master analog address |
| Remarks: | The period of a waveform is the time for one complete cycle of a <br> squarewave, triangle or sawtooth. |

The duration of a ramp is the time from its minimum amplitude until it reaches its maximum amplitude.

Up means starting at minimum and rising to maximum amplitude

Down means starting at maximum and falling to minimum amplitude

The p and q fields specify the waveforms maximum and minimum amplitude.
$\mathrm{p}=$ Waveform peak or maximum amplitude
$\mathrm{q}=$ Waveform valley or minimum amplitude

## Serial N

|  | Instruction | Response |
| :--- | :--- | :--- |
| N Local RS-232 |  |  |
| Baud Rate | $>M C \underline{\mathrm{Nh}}($ )CR | ACR |

Purpose: $\quad$ Sets the baud rate of the local RS-232 port
Prerequisite: None
Default: $\quad$ Baud Rate $=300$

Battery Backed: The underlined instruction data is saved in memory if:

1) The I/O Plexer has the /M memory option

AND
2) Setup eF instruction is issued after the system is configured as
desired.

Address: Any master control address.
Remarks: The baudrate of the local port does not have to match the baud rate of the host port. They are two separate entities.

This protocol 1 start bit, 1 stop bit, 8 data bits, no parity, baud rate selectable, and 80 - character buffer

Caution:
The baud rate is reset to 300 on power up if not battery backed.
Example: This instruction sets the local RS-232 port at 2400 baud.

## Serial 0

Instruction
O Host to slave message
$>M C 0$ (Message)( )CR
Allows the host computer to send messages to an external RS-232 device connected to the I/O Plexer local RS-232 port.

Prerequisite: None
Default: None
Battery backed: Not applicable
Address: Any master control address
Remarks: $\quad$ Serial O returns a N12 response message if the remaining free space in the internal local port buffer in the I/O Plexer cannot accommodate the full message being sent by the host. This buffer is circular and can hold more than one message at a time. A message is rejected if it cannot fit in the buffer in its entirety. It should be sent again after the local device has had time to read the previous message.

The codes, $>$, CR, and codes 80 H through FFH may not be included in network traffic from the host.
/ and $\backslash$ Have special meanings as described below. Any character (0H to FFH) may be sent by embedding the "/" (forward slash) followed by the 2 digit hex code for the character. For example, if we wanted to say "and/or" we would put it in as "and /2For" Appendix H has a Hex/ Decimal/ ASCII table

Messages between the host and an I/O Plexer can contain up to 80 transmitted characters.

Caution: $\quad \mathrm{A} \backslash$ in the message outputs a $C R$ and a line feed. Multiple $\backslash$ 's can be used, each results in a CR and a line feed at the receiving device. $C R$ cannot be sent because it is interpreted as an end of message character.

The start of message character, $>$, in a host-to-slave message can not be used, because it is interpreted as a new message. It can be sent using the embedding technique.

Example: $\quad$ This sends a message to the slave "your own message here!"
Instruction Response
$>120$ Your very own message here! A5CR ACR
Message as seen at the slave:
Your own message here !

## Serial P, PP

Instruction Response

| P Message for Host? | $>M C P($ ) CR | A(Message)( )CR |
| :--- | :--- | :--- |
| PP Partial | $>M C P P($ )CR | A(Message)( )CR |

Purpose: Allows the Host to read the local RS-232 port device message
Default: None
Battery Backed: Not applicable
Address: Any master control address
Remarks: $\quad$ Messages between the I/O Plexer and host can contain up to 80 printable ASCII characters.

Mechanisms for sending ,>, and CR, characters not allowed in network traffic, depend on an agreement between the host and slave and is outside the control of the I/O Plexer.

Caution: Serial PP reads the data gathered at the local RS-232 port whether or not whether or not a carriage return was received. This could be a partial message. Partial messages read are not duplicated in the next read.

A Turn pump On! 69 CR

## APPENDICES

Most I/O Plexer instructions have a position field following the function code. The contents of this field determine which modules are affected by the instruction. Some functions affect all modules, in these, the position field determines what the effect is for each module. In either case, the construction of the position field follows the same rules.

The position field is a 4 hex digit representation of a 16 digit number. The position field is a 16 digit number (one digit for each possible module) but each digit can only be a 1 or a 0 . (These digits are called bits)

To fill the position field, perform the following steps:

1. Make a list of the modules that the instruction is to affect, for example: $0,3,8,12$, and 15.
2. Make a 16 digit number with a 1 in each position listed in step 1 and a zero in all other positions. The leftmost digit of the number is module 15 , the right most is module 0 . The number for our example is:

1001000100001001

3. Divide the number built in step 2 into four 4 digit numbers. Our example appears as: 1001000100001001.
4. Using the table below, look up each of the 4 digit numbers in step 3 and replace it with the corresponding hex number or letter. Our example becomes 9109H. This is the value that should be put in the position field of the instruction. This table is on the Quick reference guide for easy access.

Module\#: $\quad 15141312 \quad 1110 \quad 9 \quad 8 \quad 7 \begin{array}{llllllll}7 & 6 & 5 & 4 & 3 & 2 & 1 & 0\end{array}$ $-1^{\text {st }}$ Char- $\quad-2^{\text {nd }}$ Char- $\quad-3^{\text {rd }}$ Char- $\quad-4^{\text {th }}$ Char-

| Bit pattern | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 0111 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Hex Digit: | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Bit Pattern: | 1000 | 1001 | 1010 | 1011 | 1100 | 1101 | 1110 | 1111 |
| Hex Digit: | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |

5. It is always acceptable to use a 4-digit value in a instruction which requires a position field. Some instructions also accept an abbreviated version which has had the leading hex zeroes omitted. In some instructions the position field is optional and assumes a value of FFFFH (all modules affected) if it is omitted.

Setup eC instruction tags correct checksum to the end of the N02 response message. Transmit instruction $>00 \mathrm{eC} 08 \mathrm{CR}$. Now any instruction can be assembled in the usual manner, but enter 00 for checksum. The unit returns a N02 response message plus the correct checksum.

Wild card: If ?? is added to the instruction instead of a checksum, the instruction is executed. It sends a "don't care" value for checksum. This method is not recommended for programming because it does not insure proper communication error checking.

Calculation method: Checksum can also be obtained by adding all decimal values of ASCII characters that make up an instruction or response (exclude $>$ for instructions and A for responses). Repeatedly subtract 256 from this sum until the remainder is less than 256 . The checksum is the 2 digit hex equivalent of the remainder.

Example:

| Instruction |  | Response |
| :--- | :--- | :--- |
| $>80 \mathrm{~L} 0800(~) \mathrm{CR}$ |  | A1CAC( )CR |
| Instruction |  |  |
| Character |  | ASCII |
| 8 | Value |  |
| 8 | 56 |  |
| 0 | 48 |  |
| L | 76 |  |
| 0 | 48 |  |
| 8 | 56 | 48 |
| 0 | $\frac{48}{380}$ |  |
| 0 |  |  |
| $380 \mathrm{D}-256 \mathrm{D}=124 \mathrm{D}=7 \mathrm{CH}$ |  |  |

The checksum is 7 CH and the complete instruction is:
$>80 \mathrm{~L} 08007 \mathrm{CCR}$

The response is:

| Character | ASCII |
| :--- | :--- |
| 1 | 49 |
| C | 67 |
| A | 65 |
| C | $\underline{67}$ |
|  | $248 \mathrm{D}=\mathrm{F} 8 \mathrm{H}$ |

The checksum is F 8 H and the complete response is: A1CACF8CR
Note: $\quad$ The ASCII values can be obtained from appendix H .

## Analog L, a, c, d, f, M, U $k$ data field

ResponseD $=\{(\mathrm{k}-4096) / 4095\} *(\mathrm{~F}-\mathrm{Z})+\mathrm{Z}$
Where:
ResponseD is actual value in the same engineering units as F and Z .
k is the 4 digit hex response from the I/O Plexer converted to decimal.
F is the full scale value of the module and Z is the zero scale of the module.
These are shown for the standard modules in the table below.

| DuTec <br> Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| IV50M | 50 | 0 | mVolts |

Example: $\mathrm{k}=19 \mathrm{FCH}=6652 \mathrm{D}$
II420 Module

$$
\begin{aligned}
\text { Response valueD } & =[(\{6652-4096\} / 4095) *(20-4)+4] \\
& =[(2556 / 4095) * 16+4] \\
& =[(0.624) * 16+4] \\
& =9.984+4 \\
& =13.984 \mathrm{~mA}
\end{aligned}
$$

## Analog g, h k Data Field

If the first hex digit is F , then the value represents a negative offset. Use the formula that applies.

$$
\begin{aligned}
& \text { Positive Offset } \\
\text { OffsetD }= & {[(\mathrm{k} / 4095) *(\mathrm{~F}-\mathrm{Z})]+\mathrm{Z} } \\
& \text { Negative Offset } \\
& (\text { First digit is } \mathrm{F}) \\
\text { OffsetD }= & \{[(\mathrm{k}-65536) / 4095] *(\mathrm{~F}-\mathrm{Z}]\}+\mathrm{Z}
\end{aligned}
$$

Where:

Offset is the actual offset in decimal as seen by the I/O Plexer.
k is the 4 digit hex value converted to decimal that was returned by the I/O
Plexer. The formula to use is chosen based on the first digit of this number
F is the full scale value of the module and Z is the zero scale value of the module.
These are shown for the standard modules in the table below.

| DuTec <br> Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| IV50M | 50 | 0 | mVolts |
| IV100M | 100 | 0 | mVolts |
| IV1 | 1 | 0 | Volts |
| IV5 | 5 | 0 | Volts |
| IV10 | 10 | 0 | Volts |
| IV5B | 5 | -5 | Volts |
| IV10B | 10 | -10 | Volts |
| II420 | 20 | 4 | mAmps |

Example: $k=01 \mathrm{FFH}=511 \mathrm{D}$
IV5B Module
OffsetD $=[(511 / 4095) *(5-\{-5\})]+\{-5\}$
$=[0.125 * 10]-5$
$=1.25-5$
$=-3.75$ Volt Note: This is a -5 to 5 Volt Module!!
Example: $k=F C 00 H=64512 \mathrm{D}$
IV10 Module
OffsetD $=\{[(64512-65536) / 4095] *[10-0]\}+0$
$=\{[-1024 / 4095] * 10\}+0$
$=\{-0.25 * 10\}+0$
$=-2.5$ Volt

## Analog W k data field

Negative offset calculations are taken care of by subtracting the value from 65,536. Please use the appropriate formula.

$$
\begin{gathered}
\text { Positive Offset } \\
\mathrm{k}=[(\text { Desired }-\mathrm{Z}) /(\mathrm{F}-\mathrm{Z})] * 4095 \\
\text { Negative Offset } \\
\mathrm{k}=65536+\{[(\text { Desired }-\mathrm{Z}) /(\mathrm{F}-\mathrm{Z})] * 4095\}
\end{gathered}
$$

Where:
K is the decimal number that is converted to its 4 digit hex value and plugged into the instruction.
Desired is the actual offset you want in the same engineering units as F and Z .
F is the full scale value of the module and Z is the zero scale of the module. These are shown for the standard modules in the table below.

| DuTec <br> Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| IV50M | 50 | 0 | mVolts |
| IV100M | 100 | 0 | mVolts |
| IV1 | 1 | 0 | Volts |
| IV5 | 5 | 0 | Volts |
| IV10 | 10 | 0 | Volts |
| IV5B | 5 | -5 | Volts |
| IV10B | 10 | 4 | Volts |
| II420 | 20 | mAmps |  |

## Analog W k data field (Continued)

Example:
Desired $=0.02$ Volts IV1 Module
$\mathrm{k}=\quad[(0.02-0) /(1-0)] * 4095$
$\mathrm{k}=\quad[0.02 / 1] * 4095$
$\mathrm{k}=\quad 0.02 * 4095$
$\mathrm{k}=\quad 81.9 \mathrm{D}=0051 \mathrm{H}$
Example: $\quad$ Desired $=-11$ Volts IV10B Module

$$
\begin{aligned}
& \mathrm{k}=65536+\{[(-11-[-10]) /(10-[-10])] * 4095\} \\
& \mathrm{k}=65536+\{[(-11+10) / 20] * 4095\} \\
& \mathrm{k}=65536+\{[-1 / 20] * 4095\} \\
& \mathrm{k}=65536+\{-0.05 * 4095\} \\
& \mathrm{k}=65536-204.75 \\
& \mathrm{k}=65331 \mathrm{D}=\mathrm{FF} 33 \mathrm{H}
\end{aligned}
$$

## Analog X, Z, $k$ data field

GainD = k / 4096
Where:
Gain is the decimal value of the gain set by the I/O Plexer.
k is the 4 digit hex k data field converted to decimal.
Example:
k returned is $1800 \mathrm{H}=6144 \mathrm{D}$

$$
\begin{aligned}
& \text { Gain }=6144 / 4096 \\
&=1.5
\end{aligned}
$$

## Analog Y k data field

$\mathrm{k}=($ Desired $* 4096) \quad$ Convert to 4 hex digits
Where:
k is the four hex digit data entered in the instruction.
Desired is the actual decimal value required.
Example:
Desired $=1.1$
$\mathrm{k}=1.1 * 4096$
$\mathrm{k}=4505.6 \mathrm{D}=1199 \mathrm{H}$

## Analog N I \& m data field

These two fields set the upper and lower range limits. Any time an analog input goes above or below these limits a latch is set. These values are set using a 3-digit hex value. The 1000 H offset is not used on these values.

1 or $m=\{[($ RangeD -Z$) /(\mathrm{F}-\mathrm{Z})] * 4095\}$ Convert to 3 hex digits.
Where:
1 or $m$ is a value that needs to be converted to 3 hex digits and entered into the instruction.
Range D is the actual range value that is desired in the same engineering units as F and Z.

F is the full scale value of the module and Z is the zero scale of the module. These are shown for the standard modules in the table below.

| DuTec <br> Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| IV50M | 50 | 0 | mVolts |
| IV100M | 100 | 0 | mVolts |
| IV1 | 1 | 0 | Volts |
| IV5 | 5 | 0 | Volts |
| IV10 | 10 | 0 | Volts |
| IV5B | 5 | -5 | Volts |
| IV10B | 10 | -10 | Volts |
| II420 | 20 | 4 | mAmps |

## Analog N 1 \&m data field (Continued)

Example:
IV5B Module
Upper Limit $=4$ Volts
Lower limit $=-4$ Volts
Upper limit
$1=\{[(4-[-5]) /(5-[-5])] * 40095\}$
$1=\{[(4+5) /(5+5)] * 4095\}$
$1=\{[9 / 10] * 4095\}$
$1=3685.5=\mathrm{E} 65 \mathrm{H}$
Lower Limit
$\mathrm{m}=\{[(-4-[-5])] /(5-[-5])] * 4095\}$
$m=\{[(-4+5) /(5+5)] * 4095\}$
$\mathrm{m}=\{[1 / 10] * 4095\}$
$\mathrm{m}=409.5=199 \mathrm{H}$

## Analog J and S I data field:

$1=\{[($ DesiredD -Z$) /(\mathrm{F}-\mathrm{Z})] * 4095\}$ Convert to 3 hex digits.
Where:

1 is the 3 digit value to be entered into the instruction.
DesiredD is the actual value desired in decimal based on the module units. For example, if you want a module to read 2.5 Volts then DesiredD $=2.5$

F is the full scale value of the module and Z is the zero scale of the module. These are shown for the standard modules in the table below.

| DuTec Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| OV5 | 5 | 0 | Volts |
| OV10 | 10 | 0 | Volts |
| OI420 | 20 | 4 | mAmps |

Example: $\quad 3.6$ Volts output by a OV10 Module

$$
\begin{aligned}
1 & =[(3.6-0) /(10-0)] * 4095 \\
& =0.36 * 4095 \\
& =1474.2
\end{aligned}
$$

$=5 \mathrm{C} 2 \mathrm{H}$ is the value entered in the 1 data field.

## Analog k 1 data field:

ResponseD $=[(1 / 4095) *(\mathrm{~F}-\mathrm{Z})+\mathrm{Z}]$
Where:
Response is actual value read by the input in engineering units.
1 is the 3 digit hex value converted to decimal.
F is the full scale value of the module and Z is the zero scale of the module. These are shown for the standard modules in the table below.

| DuTec Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| OV5 | 5 | 0 | Volts |
| OV10 | 10 | 0 | Volts |
| OI420 | 20 | 4 | mAmps |

Example: $\quad 78 \mathrm{FH}$ is returned from a OI420 Module
$78 \mathrm{FH}=1935 \mathrm{D}$

$$
\begin{aligned}
\text { ResponseD } & =(1935 / 4095) *(20-4)+4 \\
& =0.473 * 16+4 \\
& =7.56+4 \\
& =11.56 \mathrm{~mA}
\end{aligned}
$$

## Analog $V$ p and $q$ data field:

p or $\mathrm{q}=[$ DesiredD -Z$) /(\mathrm{F}-\mathrm{Z}) * 4095$ Convert to 3 hex digits
Where:
p or q is the 3 hex digit value entered in the instruction.
DesiredD is the amplitude desired in engineering units
F is the full scale value of the module and Z is the zero scale of the module. These are shown for the standard modules in the table below.

| DuTec Module | F | Z | Units |
| :---: | :---: | :---: | :---: |
| OV5 | 5 | 0 | Volts |
| OV10 | 10 | 0 | Volts |
| OI420 | 20 | 4 | mAmps |

Example: 18 mA is the desired maximum amplitude and 7 is the desired minimum amplitude for a OI420 ( $4-20 \mathrm{~mA}$ ) Module

$$
\begin{aligned}
& \mathrm{p}=[(18-4) /(20-4)] * 4095 \\
& =[14 / 16] * 4095 \\
& =0.875 * 4095 \\
& =3583.125=\mathrm{DFFH} \\
& \mathrm{q}=[(7-4) /(20-4)] 4095 \\
& =[3 / 16] * 4095 \\
& =0.1875 * 4095 \\
& =767.81=2 \mathrm{FFH}
\end{aligned}
$$

The data field of instructions and their responses are in hexadecimal.
Hexadecimal / decimal equivalents:

| Decima <br> 1 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Hex | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |

The two examples demonstrate the calculations that convert the base 16 hexadecimal numbers to decimal and vice versa.

## Example 1: Hex to Decimal

Decimal $=\left(1^{\text {st }}\right.$ hex digit $\left.* 4096\right)+\left(2^{\text {nd }}\right.$ hex digit $\left.* 256\right)+\left(3^{\text {rd }}\right.$ hex digit $\left.* 16\right)+(4$ th Hex digit $)$ Where each hex digit is the actual decimal equivalent of the hex digit.

Hex in =0 F E D
Decimal Equivalent

$$
\begin{aligned}
& 13 * 1=13 \\
& 14 * 16=224 \\
& 15 * 256=2840 \\
& 0 * 4096=0
\end{aligned}
$$

4077D

Therefore, 0 FEDH $=4077 \mathrm{D}$

Example 2: Decimal to Hex
This method works by calculating the most significant hex digit first and working down to the least significant hex digit. The formula shown only works for a maximum of 4 digits. Any whole number results are converted to hex and the remainder is carried over to determine the next hex digit.

Decimal in $=4077$ D
Most significant hex digit:
$4077 / 4096<1$ therefore the most significant digit is 0 . 0???

And the remainder carried over is: $4077-(0) * 4096=4077$
$2^{\text {nd }}$ Hex digit:
$4077 / 256=15+$ Therefore the $2^{\text {nd }}$ hex digit is $F$
0F??
And the remainder carried over is $4077-(15) * 256=237$
$3^{\text {rd }}$ hex digit:
$237 / 16=14+$ therefore the $3^{\text {rd }}$ hex digit is E
0FE?
and the remainder carried over is $237-(14) * 16=13$
$4^{\text {th }}$ hex digit:
Therefore the least significant digit is $13=\mathrm{D}$.
0 FEDH is the hex equivalent.

The third party software vendors listed below all have drivers which will support the I/O Plexer. For further information on these companies please contact the person listed below.

[^0]:    * Not all modules can generate this range

[^1]:    Example:
    This message is "Turn pump On!"
